## ABSTRACT

2        The invention is a system method for providing extended functionality for a HAVi  
3        compatible device. The HAVi compatible device is connectable to a HAVi network. The  
4        extended functionality is defined by control data stored on a remote server external to the  
5        HAVi network. The remote server is connected to an external network. The external  
6        network comprises a network external to the HAVi network. The HAVi network  
7        comprises several other HAVi compatible devices. The system comprises an external  
8        network connection device for providing data communications between the HAVi  
9        network and the remote server. The external network connection device is connectable to  
10       the external network. The external network connection device is for receiving the control  
11       data from the remote server. The system further includes a control module, comprising a  
12       device control module (DCM) containing a special functional control module (FCM).  
13       The control module is for providing the extended functionality for the HAVi compatible  
14       device based on the control data.
